First-order Partial Differential Equations 1.1 Introduction Let $u = u(q_1, \dots, q_n)$ be a function of n independent variables q_1, \dots, q_n . A Partial Differential Equation (PDE for short) is an equation that contains the independent variables q_1, \dots, q_n , the dependent variable or the unknown function u and its partial derivatives up to some order.

In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 + 3x + 2 = 0$. However, it is usually impossible to write down explicit formulas for solutions of partial differential equations.

A partial differential equation is an equation that involves x , u , and partial derivatives of u . Quite often, x represents only spatial variables. However, many equations are evolutionary , meaning that $u = u (x , t)$ depends also on time t and the PDE has time derivatives.
